1. THE CORPUS

The corpus consists of 617 chats that were sent in by the Swiss population in 2014 through a fixed procedure that was communicated in the press in order to get people interested. The individual chats were checked for their permission to use them and for chats that had to be removed. Furthermore, demographic data were linked to the chats.

In a first step the most basic processing of the data took place such as to allow the project members to work with the data. This included the anonymization and the annotation of a main language per chat and thus the creation of subcorpora.

In a later step, more annotations were applied to the corpus. This included a more profound annotation of languages (i.e. each message was annotated for its language as opposed to the chat annotation performed in the first step), part of speech annotations were applied and the German dialectal data was normalized.
